

V2 Revamp vs. Legacy Website

How the new site is built, how it differs from the current site, and why the V2 foundation is the better platform going forward.

V2 Revamp

Milestone-based rebuild

Legacy

Currently live

Governance

V2_CONSTITUTION.md

Status: V2 is a governed, milestone-based rebuild. The V2 templates are **built and staged but not yet activated** — all legacy templates remain live and untouched. See [V2_CONSTITUTION.md](#) and [V2_REVAMP_REPORT.md](#).

1 The short version

The legacy site was built page-by-page: each template carried its own copy-pasted markup and its own inline styling, and some values (phone number, "latest blog" cards) were hardcoded into the markup. That works — but it makes the site inconsistent, hard to change, and easy to break.

V2 rebuilds the same store on a **single shared design system** with **reusable components** and **real store data** instead of duplicated code and baked-in values. Same store, cleaner engine.

2 How the V2 site works

- **One design system.** Every V2 component pulls spacing, color, typography, and motion from shared tokens in `css/sd2-global.css`. Change a token once → it updates everywhere.
- **Reusable components.** Buttons, badges, price blocks, stock indicators, product cards, cart drawer, mega menu, and footer are standalone partials (e.g. `sd2-v2-price-block.mvt`, `sd2-v2-buy-button.mvt`). Pages assemble blocks instead of re-declaring markup.
- **Real data, not placeholders.** The footer phone number reads from the store-config token, and the "Latest From The Blog" cards pull real blog data with a graceful fallback — instead of hardcoded/dummy values.
- **Verified links.** Every nav / footer / help-center link target was checked against real template files and real Miva tokens — no guessed or broken URLs.
- **A premium interaction layer.** V2 adds a motion / 3D interaction system for a more modern feel that the legacy site does not have.

3 Legacy vs. V2 at a glance

Area	Legacy site	V2 revamp
Styling	Per-template inline / duplicated CSS	One shared token system (<code>css/sd2-global.css</code>)
Components	Copy-pasted markup per page	Reusable canonical partials
Data	Some hardcoded values (phone, blog cards)	Real store/blog tokens with fallback
Consistency	Drifts page to page	Consistent by construction
Maintainability	Change many files to update one thing	Change one token/partial, updates everywhere
Link integrity	Mixed / unaudited	Audited against real templates & tokens
Third-party risk	SearchSpring wired into every page <code><head></code>	Confirmed inert, de-risking its cancellation
Motion / feel	Static	Added 3D / premium interaction layer

4 Why V2 is better than legacy

- 1 Consistent** — shared tokens mean the whole site looks and behaves the same way, instead of small differences creeping in per page.
- 2 Easier to maintain** — one change to a token or partial propagates everywhere, instead of hunting through many duplicated templates.
- 3 More trustworthy content** — real store/blog data replaces hardcoded and dummy values, so the site stays accurate without manual edits.
- 4 Fewer hidden risks** — links verified, and the cancelled SearchSpring dependency confirmed inert before removal.
- 5 More modern experience** — the added motion/interaction layer gives a more premium feel than the static legacy pages.

5 What's still outstanding (honest status)

V2 is a real improvement in **foundation**, but it is not finished:

- V2 templates are **not activated** yet — work stays in preview/staging pending milestone sign-off (M3–M9: Homepage, Category/Listing, Search, PDP, Cart/Checkout, Dashboard, Final Polish — not yet started).
- Blog footer card **images** are still placeholder graphics (a content/photo gap, not a code bug).
- The PDP test template (`prod-product_display-v2-test.mvt`) has real Miva wiring only for name/price/image/description/add-to-cart; breadcrumbs, extra media, video, spec fields, reviews, related products, and bundles are still placeholders.
- No human browser/visual QA yet — fixes are template/code-level verified only. Manual review of the staging URL is required before sign-off.
